-----------------------------------	-----

INTRODUCTION

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires—household, woman's, man's, and biomarker—were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-4. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designated to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for 30-70 percent of the total district population. The rural sample was selected

through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and earlier rounds may not be strictly comparable due to differences in sample size and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Tripura was conducted in all 4 districts of the state from 2 February to 2 August 2015 by Development & Research Services Pvt. Ltd. (DRS) and collected information from 4,510 households, 4,804 women age 15-49 (including 955 women interviewed in PSUs in the state module), and 878 men age 15-54. Survey response rates were 97 percent for households, 96 percent for women, and 89 percent for men

This report presents the key findings of the NFHS-4 survey in Tripura, followed by detailed tables and an appendix on sampling errors.

At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Household composition

Three in 10 of Tripura's households (30%) are in urban areas. On average, households in Tripura are comprised of 4 members. Fourteen percent of households are headed by women, with 11 percent of the population living in female-headed households.

The vast majority of households in Tripura have household heads who are Hindu (84%). Seven percent of households have household heads who are Muslim and 5 percent have Christian household heads.

Thirty-one percent of households in Tripura have household heads who belong to a scheduled tribe, 21 percent belong to a scheduled caste, and 18 percent belong to an other backward class (OBC). Three out of 10 household heads do not belong to scheduled castes, scheduled tribes, or other backward classes.

One quarter of Tripura's population is under age 15; only 6 percent is age 65 and over. The overall sex ratio of the population is 998 females per 1,000 males, and the sex ratio of the population under seven years of age is 987 females per 1,000 males. Eighty-nine percent of persons have an *Aadhaar* card.

Among children below 18 years of age, 4 percent have experienced the death of one or both parents. In all, 90 percent of children below 18 years of age live with both parents, 8 percent live with one parent (mostly with their mother), and the remaining 3 percent live with neither parent. Births of almost all children under 5 years of age (92%) were registered with the civil authorities, and 87 percent of children have a birth certificate.

Housing characteristics

Nearly three-quarters of households in Tripura (71%) live in a semi-*pucca* house and most of the households (93%) have electricity. Only 2 percent of households do not use a sanitation facility, which means that household members practice open defecation, down from 3 percent at the time of NFHS-3. Open defecation is rare among urban households.

Only 9 percent of households in Tripura have water piped into their dwelling, yard, or plot.

Eighty-seven percent of households use an improved source of drinking water, but only 9 percent have water piped into their dwelling, yard, or plot. Urban households (16%) are more likely than rural households (6%) to have water piped into their dwelling, yard, or plot. Seventy percent of households treat their drinking water to make it potable (mostly using a ceramic, sand, or other water filter). Less than one-third of households (32%) use a clean fuel for cooking.

Selected household possessions

Almost all urban and most rural households in Tripura have a mobile phone. Ninety-six percent of households have a bank or post office account. BPL cards are held by 34 percent of households, down from 37 percent in NFHS-3. Agricultural land is owned by 27 percent of rural households and 7 percent of urban households. Overall, 21 percent of all households in Tripura own agricultural land.

EDUCATION

School attendance among children

Ninety percent of children age 6-17 years in Tripura attend school (94% in urban areas and 88% in rural areas). School attendance is almost universal (97%) at age 6-14 years, and then drops to 78 percent at ages 15-17. There is no gender disparity in school attendance in the 6-14 year age group; however, in the age group 15-17 years, 72 percent of girls compared with 83 percent of boys are attending school.

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

Literacy, educational attainment and media exposure

In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 80 percent of women age 15-49 and 90 percent of men age 15-49 are literate.

Only 12 percent of women age 15-49 in Tripura have completed 12 or more years of schooling, compared with 19 percent of men.

Twelve percent of women age 15-49 have never been to school. Only 12 percent of women age 15-49 in Tripura have completed 12 or more years of schooling, compared with 19 percent of men.

Media exposure is high among women and men in Tripura. More than 8 in 10 women and men watch television at least once a week. However, men (40%) are much more likely than

women (17%) to read a newspaper or magazine at least once a week. Only 14 percent of men and 16 percent of women are not regularly exposed to print media or other forms of media.

FERTILITY

Age at first marriage

The median age at first marriage is 19.6 years among women age 20-49 years. One-third of women age 20-24 years (33%) got married before the legal minimum age of 18, down from 42 percent in NFHS-3. Less than one-fifth of men age 25-29 years (16%) got married before the legal minimum age of 21, up from 11 percent in NFHS-3.

Fertility levels

The total fertility rate (TFR) in Tripura is 1.7 children per woman, implying that the state has reached a level of fertility that is below replacement level. Fertility decreased by 0.5 children in the 13 years between NFHS-1 and NFHS-3, and has declined further by 0.5 children in the 10 years between NFHS-3 and NFHS-4.

Fertility in urban areas, at 1.4 children per woman, is far lower than in rural areas (1.8 children per woman). Among births in the three years preceding the survey, 5 percent were of birth order four or higher, compared with 14 percent in NFHS-3.

The greatest differentials in fertility are by schooling. At current fertility rates, women with no schooling will have 1.4 children more than women who had 12 or more years of schooling (a TFR of 2.9, compared with 1.5).

Fertility Trends

*Total fertility rate
(children per woman)*

How does fertility vary with schooling?

Total fertility rate (children per woman)

Pregnancy outcome

Eighty-seven percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 13 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 8 percent of all pregnancies, and abortions accounted for 5 percent. A majority of the abortions were performed in the public health sector (57%) and 17 percent were performed in the private health sector. Ten percent of women reporting an abortion, reported having complications from the abortion.

Teenage pregnancy

Among young women age 15-19 in Tripura, 19 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, unchanged from its level in NFHS-3. Two percent of women age 15 years have started childbearing, but this proportion increases sharply to 31 percent among women who are 18 years old and to 36 percent among women who are 19 years old. Young women in rural areas are more likely to have begun childbearing (21%) than those in urban areas (13%).

Birth intervals

The median interval between births in the five years before the survey in Tripura is 49.0 months, 10 months longer than in NFHS-3. Six percent of births take place within 18 months of the last birth and 14 percent occur within 24 months. One-third of births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality.

*One-third of births in Tripura occur within three years
of the previous birth.*

Fertility preferences

Seventy percent of currently married women and 67 percent of currently married men want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, about half of women and men would like to wait at least two years before the next birth. Ninety percent of women and men consider the ideal family size to be two or fewer children.

In Tripura there is a strong preference for sons. Eleven percent of women and 16 percent of men want more sons than daughters, but only 4 percent of men and women want more daughters than sons. However, most men and women would like to have at least one son and at least one daughter.

Women’s desire for more children is somewhat affected by their current number of sons. For example, among women with two children, 92 percent with one son and 91 percent with two sons want no more children, compared with only 84 percent with two daughters who want no more children. The proportion of currently married women with two children who want no more children irrespective of their number of sons has decreased by 2 percentage points in the 10 years since NFHS-3 (from 92% to 90%).

How does son preference affect women’s desire for children?

Percentage of currently married women with two children who want no more children

In Tripura, unplanned pregnancies are not common. If all women were to have only the number of children they wanted, the total fertility rate would have been 1.6 children per woman, instead of the current level of 1.7 children per woman.

FAMILY PLANNING

Contraceptive knowledge and use

Knowledge of contraception is almost universal in Tripura. However, some methods are still less well known. Only two-thirds of currently married women know about injectables and 14 percent know about female condoms. Less than three-fourths of currently married women know about male sterilization (73%) and IUD/PPIUD (71%). Among all women, 47 percent know about emergency contraception.

The contraceptive prevalence rate among currently married women age 15-49 is 64 percent, down from 66 percent in NFHS-3. Modern method use, at 43 percent, has decreased by 2 percentage points from its level in NFHS-3 (45%). The share of female sterilization in contraceptive-method use

How many women use family planning?

Percentage of currently married women

has decreased from 27 percent in NFHS-3 to 22 percent in NFHS-4. Contraceptive use in NFHS-4 increases sharply with age from 34 percent for women age 15-19 to 77 percent for women age 30-39, after which it decreases to 54 percent among women age 40-49.

In Tripura, contraceptive use is higher in urban areas (67%) than in rural areas (63%). Contraceptive prevalence does not vary greatly by schooling; however, one-fourth of currently married women with less than 5 years of schooling use female sterilization, compared with 9 percent of women with 12 or more years of schooling. Almost a quarter of women (24%) with 12 or more years of schooling use a traditional method compared with one-fifth of women with no schooling.

Women in Tripura are more likely to use contraception if they already have a son. For example, among women with two children, 75 percent with at least one son use a method of family planning, compared with 69 percent of women with two daughters and no sons.

What contraceptive methods do women use?

Currently married women

The most common method used by currently married women in Tripura is the pill (26%), which accounts for 41 percent of all contraceptive use.

Ninety-three percent of sterilized women had their sterilization operation in a public sector health facility, mainly in a government or municipal hospital.

Almost 9 out of 10 pill and condom/Nirodh users get their supply from the private health sector (89% and 86%, respectively). Nonetheless, 11 percent of pill users and 14 percent of condom/Nirodh users get their supply from the public health sector.

The 12-month discontinuation rate for all methods is 22 percent. Twenty-two percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reason for discontinuation is the desire to become pregnant.

More than one-fifth (22%) of users of modern spacing methods discontinued use within the first year after they adopted the method.

Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Only 49 percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 40 percent were told about the possible side effects or problems with their method, and even fewer (36%) were told what to do if they experienced any side effects.

Men's attitudes

Thirty-seven percent of men in Tripura agree that contraception is women's business and a man should not have to worry about it. However, only 21 percent think that women using contraception may become promiscuous. A large majority of men (74%) know that a condom, if used correctly, protects against pregnancy most of the time.

Contraceptive Prevalence Rate by District

Percentage of currently married women

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 11 percent of currently married women have an unmet need for family planning, almost unchanged since NFHS-3. Currently, 86 percent of the demand for family planning is being satisfied and 57 percent of the demand is being satisfied by modern methods. The percentage of demand for family planning that is satisfied has hardly changed in the 10-year period since NFHS-3.

INFANT AND CHILD MORTALITY

The infant mortality rate in Tripura in NFHS-4 is estimated at 27 deaths before the age of one year per 1,000 live births, down from the NFHS-3 estimate of 52, the NFHS-2 estimate of 44, and the NFHS-1 estimate of 76.

As expected, boys have higher mortality rates than girls, especially during the neonatal period (in the first month of life) and during the postneonatal period (ages 1-11 months). Mortality between ages 1 and 5 years is higher for girls than boys.

Trends in Infant Mortality

Deaths per 1,000 live births

MATERNAL HEALTH

Antenatal care

Among mothers who gave birth in the five years preceding the survey, more than nine in ten received antenatal care (ANC) for their last birth from a health professional (92% from a doctor). Six percent did not receive any antenatal care. Among mothers who gave birth in the five years preceding the survey, a little more than two-thirds (71%) registered the pregnancy for the most recent live birth. Among the registered pregnancies, 83 percent received a Mother and Child Protection Card (MCP Card).

Two-thirds of women (66%) received antenatal care during the first trimester of pregnancy, as is recommended. Sixty-four percent of mothers had four or more antenatal care visits; urban women were more likely to receive four or more antenatal visits than rural women. The proportion of women who received four or more antenatal care visits and the proportion of women who had their first antenatal care visit in the first trimester of pregnancy for their last births have both increased

Four or More Antenatal Care Visits by District

Percentage of last births in the past five years

substantially in the 10 years since NFHS-3. For 86 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 13 percent consumed them for the recommended 100 days or more. More than 93 percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Ten percent of mothers took an intestinal parasite drug during pregnancy.

Sixty-four percent of mothers in Tripura received at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, most received advice on each of the five different areas (77% received advice on breastfeeding, 72% on keeping the baby warm, 71% on cord care, 69% on the importance of institutional delivery, and 59% on family planning).

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Tripura, about 90 percent or more of women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken, their blood pressure measured, and a blood sample taken (97-98%), having their abdomen examined (92%) and having a urine sample taken (89%).

An ultrasound test was performed during 51 percent of pregnancies in the five years preceding the survey. Women with at least 12 years of schooling were much more likely to have an ultrasound test than women with no schooling. Eighty-nine percent of women with at least 12 years of schooling had an ultrasound test compared with 21 percent of women with no schooling.

Delivery care

Four-fifths of births (80%) take place in a health facility (mostly a government facility) and 20 percent take place at home. The percentage of births in a health facility increased dramatically in the 10 years between NFHS-3 and NFHS-4, from 47 percent in NFHS-3 to 80 percent in NFHS-4. Institutional births are more common among women who have received an antenatal check, women in urban areas, women with 12 or more years of schooling, women who are having their first birth, women from a scheduled caste or an other backward class, and Hindu women.

For 89 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery kit was used for 41 percent of deliveries. Ninety-one percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

Eighty-one percent of births during the past five years took place with assistance from a skilled provider, and another 15 percent were delivered by a traditional birth attendant.

Twenty-one percent of births during the past five years were delivered by caesarean section. Almost half of caesarean sections (9% of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 33 percent received financial assistance under the *Janani Suraksha Yojana* (JSY). Rural women were more likely than urban women to receive financial assistance under JSY, as were women with less than 10 years of schooling. Scheduled tribe women were more likely than any other caste/tribe group of women to receive financial assistance under JSY.

Are babies being delivered safely?

Percentage of births in the past five years

Institutional Delivery by District

Percentage of births in the past five years

Eighty percent of children in Tripura who were born in the last five years were born in a health facility.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Tripura, 69 percent of mothers had a postnatal check after their last birth and 63 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common following births in a health facility; 74 percent of births in public health facilities and 80 percent of births in private health facilities were followed by a postnatal check for the mother within two days of birth, compared with 5 percent of home births.

Only 9 percent of last births in the five years preceding the survey received a health check in the first two days after birth. Only 4 percent of home births received a health check in the first two days after birth.

Male involvement in maternal care

Eighty-five percent of men with a child under three years of age said that the youngest child's mother received antenatal care. Three-fifths of men with a child under three years said they were present during at least one antenatal check received by the child's mother; 66 percent said they were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 48-56 percent of men were told about the signs of specific pregnancy complications (vaginal bleeding, high blood pressure, convulsions, prolonged labour, and severe abdominal pain).

Sixty-one to 77 percent of fathers with a child less than three years of age were given information about various aspects of maternal care. Seventy-seven percent were told about importance of delivering the baby in a health facility, 70% were told about the importance of proper nutrition for the mother during pregnancy and 61 percent were told about family planning or delaying the next child by a health provider or a health worker.

CHILD HEALTH

Vaccination of children

Only a little over half (55%) of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, most children are at least partially vaccinated; only 13 percent have not received any vaccinations at all.

Eighty-two percent of children have received a BCG vaccination. However, only 7 in 10 have received other basic vaccinations (70% have received at least the recommended three doses of polio vaccine, 71% have received the three recommended doses of DPT vaccine, and 70% have been vaccinated against measles). There is considerable dropout between the first and third doses of DPT vaccine (from 80% to 71%) and polio vaccine (from 86% to 70%).

Trends in Vaccination Coverage

Percentage of children 12-23 months receiving vaccinations

Between NFHS-3 and NFHS-4, there was a large increase in vaccination coverage for three doses of DPT (from 60% to 71%), and for measles (from 60% to 70%), and a smaller increase in three doses of polio vaccine (from 65% to 70%), while BCG vaccination coverage remained almost the same. Overall, there was a small increase in the coverage of all basic vaccinations (from 50% to 55%). In addition, almost two-thirds of children (65%) have received at least one dose of hepatitis B vaccine, but only just over half (54%) have received all three recommended doses of hepatitis B vaccine.

Coverage with all basic vaccinations is higher in urban areas than in rural areas (64% versus 51%) and is higher for male children than for female children (61% versus 49%).

Coverage of All Basic Vaccinations by District

Percentage of children 12-23 months

Childhood illnesses

In the two weeks before the survey, 3 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that was chest related and/or (2) difficult breathing that was chest related).

Twelve percent of children under age five were reported to have had fever in the two weeks preceding the survey; 76 percent of these children were taken to a health facility or provider for treatment.

Overall, 5 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Sixty-six percent of these children were taken to a health facility or health provider. Almost all mothers of young children (98%) have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 46 percent of children with diarrhoea were given ORS. Eighteen percent of children with diarrhoea were given gruel and almost half of the children (49%) were given some type of oral rehydration therapy (ORT). Nineteen percent were given zinc supplements. Eighteen percent of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Tripura only 7 percent of children with diarrhoea received more to drink than normal. Only about one-third of children (32%) received the same amount to drink as usual. Of greater concern, three-fifths of children with diarrhoea were given less to drink or nothing at all to drink. Only 20 percent of children with diarrhoea were given the same amount of food or more food, as recommended. Slightly less than two-fifths of children with diarrhoea (38%) were given ORT and continued feeding (data not shown in a table).

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

Sixty-one percent of children under 6 years receive services of some kind from an *anganwadi* centre. The most common services that age-eligible children receive are supplementary food (59%), early childhood care or preschool (55% of children age 3-5 years), growth monitoring (48%), and health check-ups (40%). The service that is least likely to be accessed is immunization (29%). Less than half of the mothers of children who were weighed at an *anganwadi* centre (49%)

received counseling from an *anganwadi* worker or an ANM. Among children under 6 years, more than half of their mothers (54%) received any service from an *anganwadi* centre during pregnancy, and almost half of their mothers (49%) received any service while breastfeeding.

How many children received *anganwadi* centre services?

Percentage of age-eligible children receiving services

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Although breastfeeding is nearly universal in Tripura, only 71 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninety percent are put to the breast within the first day of life, but only 46 percent started breastfeeding in the first hour of life (as recommended). While the initiation of breastfeeding indicators show substantial improvement since NFHS-3, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. Only three percent of children are given something other than breastmilk during the first three days. Overall, 96 percent of children continue breastfeeding at 1 year and 9 in 10 (92 percent) continue breastfeeding at 2 years. The median duration of breastfeeding is more than 36 months, which is the age to which half of children are breastfed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at

age 6-8 months, only one in seven children in Tripura receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and nonbreastfed children. Less than one-fourth of children age 6-23 months (22%) are fed the recommended minimum number of times per day and even fewer (16%) are fed from the appropriate number of food groups. Only 6 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Tripura, 63 percent of children age 9-59 months were given a vitamin A supplement in the past six months, but only 46 percent of children age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Only one-fourth of children age 9-23 months ate iron-rich foods during the day or night before the survey and only eight percent of children age 6-59 months were given iron supplements in the week before the survey.

Children's nutritional status

One-fourth of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Seventeen percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 6 percent are severely wasted. Twenty-four percent are underweight, which takes into account both chronic and acute undernutrition. Three percent of children are overweight. Even during the first six months of life, when almost all babies are breastfed, 15 percent of children are stunted, 28 percent are underweight, and 29 percent are wasted.

Children's nutritional status in Tripura has improved since NFHS-3 by all three nutritional status measures. Stunting decreased from 36 percent to 24 percent in the 10 years between NFHS-3 and NFHS-4, the percentage of children who are underweight decreased from 40 percent to 24 percent; and wasting decreased from 25 percent to 17 percent. Despite the gains in stunting and underweight, child malnutrition is still a major problem in Tripura.

There are only small differences in the level of undernutrition by the sex of the child or by the child's living arrangements. However, differences are more pronounced for other background characteristics. Undernutrition decreases with increasing mother's schooling, better nutritional status of the mother, and larger child's size at birth. The level of undernutrition is relatively high for children of higher birth orders and Muslim children.

Adults' nutritional status

More than one-third of women (35%) and 32 percent of men are either too thin or overweight or obese. The proportion of women and men who are overweight or obese is very similar to the proportion of women and men who are too thin, however, at the time of NFHS-3, many more adults were thin than overweight. Nineteen percent of women and 16 percent of men in Tripura are too thin, and 16 percent each of women and men are overweight or obese. About two-thirds of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups, in rural areas, among Muslims, and among the scheduled castes and other backward classes. Overweight and obesity are most prevalent older adults, those in urban areas, and well-educated adults. Because population groups that are less likely to be too thin are the same groups that are more likely to be overweight or obese, the percentage suffering from either of these two nutritional problems is fairly constant across all groups, regardless of their educational attainment, caste, age, residence, or marital status.

Trends in Children's Nutritional Status

Percentage of children under five years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. The use of iodized salt is nearly universal in Tripura. Ninety-nine percent of Tripura's households were using iodized salt at the time of the survey, a slight increase from 97 percent in NFHS-3.

How many women are at a healthy weight for their height?

Percent distribution of women

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Tripura, especially among women and children.

Among children between the ages of 6 and 59 months, about half – 48 percent are anaemic. This includes 31 percent who are mildly anaemic, 18 percent who are moderately anaemic, and less than 1 percent who suffer from severe anaemia. Anaemia decreases with increasing age of the child. Although anaemia levels vary somewhat according to background characteristics like sex of the child, anaemia among children is widespread in every group. Almost half of children (44%) are anaemic even if their mother has 12 or more years of schooling.

Fifty-five percent of women in Tripura have anaemia, including 42 percent with mild anaemia, 12 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high for women who are breastfeeding and women who are widowed, divorced, separated, or deserted, but anaemia exceeds 50 percent for every group of women except Muslim women. The prevalence of anaemia among women has decreased in the past decade, from 65 percent to 55 percent. One-fourth of men (25%) are anaemic. Men in rural areas are particularly likely to be anaemic.

Anaemia among women, men, and children

ADULT HEALTH AND HEALTH CARE

Tuberculosis

In Tripura, 238 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is higher among men (335) than among women (140) and is higher in rural areas (248) than in urban areas (211).

Most respondents have heard of tuberculosis (97% of women and 95% of men), but even among those who have heard of tuberculosis, only 49 percent of women and 52 percent of men know that it is spread through the air by coughing or sneezing. Fifty-five percent of women and 39 percent of men have misconceptions about how tuberculosis is spread. Overall, 89

percent of women and 94 percent of men know that tuberculosis can be cured, and only 4 percent of women and 3 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 1,427 women age 15-49 and 1,570 men age 15-49 per 100,000 have diabetes. Overall, 3,453 women and 418 men per 100,000 suffer from asthma. The prevalence of asthma among women is higher among older age groups, Hindu women, and those in rural areas. Goitre or any other thyroid disorder is less common than asthma (1,810 cases per 100,000 women and 130 cases per 100,000 men). The prevalence of any heart disease is higher among women (3,643 per 100,000) than men (2,873 per 100,000). Among the five diseases, cancer is the least common, with 100 women and no men per 100,000 reportedly suffering from cancer.

Blood pressure (hypertension)

Sixteen percent of women age 15-49 in Tripura have hypertension, including 10 percent with Stage 1 hypertension, 2 percent with Stage 2 hypertension, and 1 percent with Stage 3 hypertension. Just over half of women (51%) have normal blood pressure including, 1 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. The prevalence of hypertension among men age 15-49 is similar to that in women. Sixteen percent of men in Tripura have hypertension, including 12 percent with Stage 1 hypertension, 2 percent with Stage 2 hypertension, and less than 1 percent with Stage 3 hypertension. Thirty-four percent of men have normal blood pressure including, 1 percent of men with normal blood pressure who are taking medicine to lower their blood pressure. For both women and men, hypertension increases with age.

Blood glucose

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Four percent of women age 15-49 in Tripura have high and very high blood glucose levels each. In comparison, 5 percent of men age 15-49 have high and very high blood glucose levels each. Older women and men have relatively high blood glucose levels.

Health examinations

In Tripura, 5 percent of women have ever undergone an examination of the cervix, 1 percent have ever undergone a breast examination, and 7 percent have ever undergone an examination of the oral cavity.

Tobacco and alcohol use

Sixty-eight percent of men and 42 percent of women age 15-49 use some form of tobacco. Men are more likely to smoke *bidis* or cigarettes (30% each) than to use other types of tobacco, while women are most likely to use *gutka* or *paan masala* with tobacco (25%). Among men, the use of any form of tobacco is higher in rural areas than in urban areas with *bidis* being especially popular in rural areas. Most men who smoke cigarettes or *bidis* smoked 5 or fewer cigarettes or *bidis* in the past 24 hours. Men are less likely to drink alcohol (58%) than to use tobacco, and only 5 percent of women say that they drink alcohol. Among men who drink alcohol, more than half drink alcohol at least once a week.

Source of health care

The public sector is the main source of health care for 91 percent of households. Household members are more likely to go to government hospitals (38%) than primary health centres (26%) or community health centres/rural hospitals (23%).

Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 58 percent of households in Tripura have any kind of health insurance that covers at least one member of the household. Health insurance coverage is somewhat more common in rural areas (70%) than in urban areas (32%). In Tripura, the *Rashtriya Swasthya Bima Yojana* (RSBY) is by far the most dominant among various insurance programmes.

Similar proportions of women (58%) and men (59%) age 15-49 years in Tripura are covered by any health scheme or health insurance. More women and men in rural areas than in urban areas are covered by any health scheme or health insurance. Health scheme or health insurance coverage is higher among women and men with no schooling or with fewer years of schooling than among those with 12 or more years schooling.

HIV/AIDS

Awareness of HIV or AIDS

Over 85 percent of women in Tripura have heard of HIV or AIDS. In urban areas, 95 percent know about HIV or AIDS, compared with 81 percent in rural areas. There is little difference in the percentage of women who have heard of HIV or AIDS by age. Women having no schooling (59%), those with no regular media exposure (60%), women belonging to a scheduled tribe (77%), and Muslim women (78%) are less likely than other women to have heard of AIDS.

Men are only slightly more likely than women to know about HIV or AIDS. Eighty-nine percent men in Tripura have heard of HIV or AIDS, including 97 percent in urban areas.

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV is transmitted and how to keep from getting it. For example, only 58 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 82 percent of men, and six-tenths of women (60%) know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 82 percent of men.

Only 28 percent of women and 37 percent of men in Tripura have a ‘comprehensive knowledge’ about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about transmission or prevention of HIV/AIDS.

Do people know how to prevent HIV/AIDS?
Percentage of women and men age 15-49

HIV or AIDS-related stigma

Around 7 in 10 women (71%) and men (69%) in Tripura would be willing to take care of a relative with HIV/AIDS in their home. Sixty-five percent of women and 77 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Two-thirds of women (66%) and 80 percent of men say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Eighty-two percent of women and 69 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

HIV or AIDS testing prior to NFHS-4, blood transfusions, and safe injections

Only 5 percent of women and 2 percent of men age 15-49 had ever been tested for HIV prior to NFHS-4. Women and men living in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-4 than rural women and men. Only 6 percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women (14%) are more likely than rural women (4%) to have been tested for HIV during ANC.

Only 6 percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Tripura, women (5%) are somewhat more likely than men (2%) to have ever had a blood transfusion. Women and men are almost equally likely to have received an injection in the past 12 months (25% each).

For only 19 percent of women and 56 percent of men who received an injection in the past 12 months, a disposable syringe was used.

SEXUAL BEHAVIOUR

NFHS-4 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, none of the women and only 2 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is marginally higher in urban areas (3%) than in rural areas (1%). Even fewer respondents said that they had multiple sex partners in the past 12 months (0.7% of men).

Hardly any men (0.1%) said they had paid for sex in the past year.

WOMEN'S EMPOWERMENT

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Tripura, 71 percent use cloth, 37 percent use sanitary napkins, and 7 percent use locally prepared napkins. Overall, 44 percent of women age 15-24 use a hygienic method of menstrual protection. Women with at least 10 years of schooling are more than five times as likely to be using a hygienic method as women with no schooling or less than five years of schooling. Only 39 percent of women in rural areas use a hygienic method of menstrual protection, compared with 57 percent of women in urban areas.

Employment and earnings

Only 32 percent of all women age 15-49 were employed in the 12 months preceding the survey; in the same period, 81 percent of all men age 15-49 were employed. Among employed women, 81 percent earned cash, including 1 percent whose earnings were in both cash and in-kind, and 18 percent were not paid at all. Almost all of the men who were employed earned cash (99%) and only 1 percent were not paid at all. Ninety-three percent of employed women worked in non-agricultural occupations, compared with 80 percent of employed men.

Only 32 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 91 percent decide how their earnings will be used, either alone or jointly with their husbands. About one-fifth (22%) of women who work for cash say that they earn more or about the same as their husbands. By contrast, 88 percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used and 23 percent of men who have cash earnings and whose wives have cash earnings say that their wife earns more or about the same as them.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are about equally likely to participate in decisions about their own health care (85%), decisions about major household purchases (85%), and decisions about visits to their own family and relatives (87%). Overall 78 percent of currently married women participate in making all three of these decisions, and 8 percent do not participate in making any of the three decisions. Participation in all three decisions varies by age, increasing from 70 percent among women age 20-24 to 82 percent among women age 40-49, and by schooling, increasing from 70 percent among women with no schooling to 85 percent among women with at least 12 years of schooling.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Men were equally as likely as women to report that they alone or jointly with their wife participate in making decisions about their own health care (85%), but much more likely than women to participate in decisions about major household purchases (97%).

Other indicators of women's empowerment

Fifty-five percent of women have some money that they can decide how to use. The proportion of women with money which they control increases steadily with age and with number of children, is higher among Hindu than Muslim women, and is highest among women who are employed for cash (84%) than any other group of women.

More than half of women (59%) have a bank or savings account that they themselves use.

More than half of women (59%) have a bank or savings account that they themselves use. This percentage is highest, at 83 percent, among women who have 12 or more years of schooling.

Eighty percent of women know of a microcredit programme in the area and 14 percent have ever taken a loan from a microcredit programme.

Only 42 percent of women are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. The only groups of women in which more than half are allowed to go to all three places alone are women age 30 and above, those in urban areas, employed women who earn cash, and those with 3-4 living children.

Ownership of assets

Fifty-six percent of women and 65 percent of men own a house alone or jointly with someone else, and 34 percent of women and 44 percent of men own land alone or jointly with someone else. Ownership of both a house and land is more common in rural than urban areas for women.

Fifty-six percent of women own a house alone or jointly with someone else, and 34 percent of women own land alone or jointly with someone else.

Forty-four percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, two in three (67%) can read SMS messages. Sixty-eight percent of urban women have a mobile phone they themselves can use, compared with 34 percent of rural women. Women with at least 12 years of schooling are 10 times as likely to have a mobile phone as women with no schooling (94% versus 9%). Only 29 percent of Muslim women have a mobile phone they can use, compared with 45 percent of Hindu women.

Forty-four percent of women have a mobile phone that they themselves use.

Gender-role attitudes

Forty percent of women believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife-beating is justified if a woman shows disrespect for her in-laws (28%), followed by if she argues with her husband (23%) and if she neglects the house or children (20%). Men are somewhat less likely to agree: 29 percent say that wife-beating is justified in some circumstances, especially if the husband suspects his wife is unfaithful (21%), and if the wife shows disrespect for in-laws or if she argues with him (19% each). Even among women and men who have completed at least 12 years of schooling, about one in five (21% of women and 16% of men) say that a husband is justified in beating his wife for one or more of the specified reasons.

Only 31 percent of women, compared with 81 percent of men, believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. Three-fourths of men, 74 percent, agree that a husband does not have the right to any of the four behaviours if a wife refuses to have sex with her husband he has a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

Among women age 15-49, 26 percent have ever experienced physical violence and 8 percent have ever experienced sexual violence. In all, 27 percent of women in Tripura have experienced physical or sexual violence. Among those who experienced physical violence since age 15, the most common perpetrator for ever-married women was the husband followed by a mother/step-mother and a father/step-father.

Twenty-seven percent of women in Tripura have experienced physical or sexual violence.

Violence during pregnancy

Two percent of women who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Women with no schooling and women belonging to scheduled castes, at 4-6 percent, are more likely than women in any other group to have experienced violence during pregnancy.

Spousal violence

Twenty-four percent of ever-married women report having been slapped by their husband; between 6-11 percent report being pushed, shaken, or having something thrown at them; having their arm twisted or hair pulled; being punched; or being kicked, dragged, or beaten up; 1 percent have experienced being choked or burned on purpose; and less than 1 percent have experienced being threatened or attacked with a knife, gun, or any other weapon. Nine percent report that their husbands have physically forced them to have sex even when they did not want to and 5 percent report that their husband forced them with threats or other ways to perform sexual acts they did not want to perform. Overall, 28 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Fourteen percent report spousal emotional violence. Few ever-married women (2%) have ever initiated violence against their husband.

Although the prevalence of spousal violence is lower among more educated women, about 1 in 7 women who have at least 10 years of schooling have experienced physical or sexual spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are more than twice as likely to be in abusive marriages themselves. Women whose husbands consume alcohol are much more likely than women whose husbands do not consume alcohol to experience spousal violence, especially if the husband often gets drunk. However, even 13 percent of women whose husbands do not drink alcohol, have experienced physical or sexual spousal violence.

Is alcohol use related to spousal physical or sexual violence?

Percentage of ever-married women experiencing violence

Note: Category "Husband drinks alcohol, but never gets drunk" not shown since there are fewer than 25 unweighted cases.

even 13 percent of women whose husbands do not drink alcohol, have experienced physical or sexual spousal violence.

A little less than half of women who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence. The most common types of injuries are cuts, bruises, or aches and eye injuries, sprains, dislocations, or minor burns.

Help seeking

Only 10 percent of women who have ever experienced physical or sexual violence by anyone have sought help. Over four-fifths (77%) of women have neither sought help nor told anyone about the violence.

Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Tripura, 2015-16

Result	Residence		Total
	Urban	Rural

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

² Protected dug well, protected spring, rainwater, community RO plant

³ Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water

⁴ Total may add to more than 100.0 because households may use more than one method of purification

⁵ Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying

⁶ Includes ventilated improved pit (VIP)/biogas latrine and twin pit/composting toilet

⁷ Facilities that would be considered improved if they were not shared by two or more households

⁸ Includes dry toilet

⁹ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called semi-*pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

¹⁰ Electricity, LPG/natural gas, or biogas

¹¹ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

¹² Frequency of smoking by anyone inside the house

Table 5 Household possessions and land ownership

Percentage of urban, rural, and total households and *de jure* population possessing various household goods, means of transport, agricultural land, a house and farm animals and having a bank/post office account, health scheme/health insurance, a BPL card, and a long-lasting insecticide-treated (LLIN) mosquito net, Tripura, 2015-16

Household possessions	Urban	Rural	Total	<i>De jure</i> population
Household goods				
Mattress	91.1	70.9	77.0	76.5
Pressure cooker	61.2	19.7	32.2	31.6

45-49	0.000	0.003	0.002	*	0.000	0.000	(0.000)	(0.000)
TFR (15-49)	1.40	1.80	1.69	1.66	2.34	2.22	1.87	2.67
CBR	12.7	16.4	15.3	17.8	22.8	21.9	17.8	23.1

Note: Rates are for the period 1-36 months preceding the survey (approximately 1990-92 for NFHS-1, 1996-98 for NFHS-2, 2003-05 for NFHS-3, and 2013-15 for NFHS-4). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation.

TFR = Total fertility rate, expressed per woman

CBR = Crude birth rate, expressed per 1,000 population

() Based on 125-249 unweighted woman-years of exposure.

* Rate not shown; based on fewer than 125 unweighted woman-years of exposure

Table 12 Fertility by background characteristics

Total fertility rate for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rate, by background characteristics, Tripura, 2015-16

Background characteristic	Total fertility rate	Percentage of women age 15-49 currently pregnant	Mean number of children ever born to women age 40-49	Total wanted fertility rate

Note: Table includes only the contraceptive methods separately shown in the table and excludes users who obtained their method from friends/relatives or husband. Total includes women who used an IUD or PPIUD, who are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Among women who were sterilized in the five years preceding the survey

Table 27 Twelve-month contraceptive discontinuation rates

Among women age 15-49 who started an episode of contraceptive use within the five years preceding the survey, the percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Tripura, 2015-16

Method	Reason for discontinuation								Switched to another method ⁴	Number of episodes of use ⁵
	Method failure	Desire to become pregnant	Other fertility related reason ¹	Side effects/ health concerns	Wanted more effective method	Other method related reason ²	Other reason	Any reason ³		
Pill	0.6	6.8	0.5	7.6	0.2	0.4	0.2	16.4	3.1	747
Rhythm	(0.0)	(13.7)	(0.6)	(0.7)	(0.0)	(1.0)	(7.5)	(23.7)	(6.5)	183
Other ⁶	1.5	17.3	0.0	0.0	0.4	4.7	10.1	34.0	6.7	370
All modern spacing methods ⁷	0.8	7.5	0.5	6.5	0.2	1.1	5.1	21.8	4.7	883
All spacing methods ⁸	0.9	11.0	0.4	4.2	0.3	2.0	5.3	24.0	5.5	1,412
All methods	0.8	10.2	0.3	3.9	0.2	1.9	4.9	22.2	5.1	1,527

Note: Figures are based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods includes female sterilization, IUD or PPIUD, and condom/*Nirodh*, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use

³ Reasons for discontinuation are mutually exclusive and add to the total in this column

⁴ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within two months of discontinuation.

⁵ Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation

⁶ Includes injectables, female condom, diaphragm, foam/jelly, standard days method, LAM, withdrawal, rhythm, and other modern and traditional methods that are not shown separately

⁷ Includes other modern spacing methods that are not shown separately

⁸ Includes other spacing methods that are not shown separately

() Based on 25-49 unweighted cases

Table 28 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Tripura, 2015-16

Background characteristic	Percentage of men who agree		Percentage of men who say that if a male condom is used correctly, it protects against pregnancy:					Number of men
	Contraception is women's business and a man should not have to worry about it	Women who use contraception may become promiscuous	Most of the time	Some-times	Not at all	Don't know/unsure ¹	Total

Table 29 Need and demand for family planning among currently married women – Continued

Percentage of currently married women age 15-49 with unmet need for family planning, percentage with met need for family planning, the total demand for family planning, and the percentage of the demand for contraception that is satisfied, by background characteristics, Tripura, 2015-16

Background characteristic	Unmet need for family planning			Met need for family planning (currently using)			Total demand for family planning ¹			Percentage of demand satisfied ²	Percentage of demand satisfied by modern methods ³	Number of women
	For spacing	For limiting	Total	For spacing	For limiting	Total	For spacing	For limiting	Total			
Caste/tribe												
Scheduled caste	2.5	6.1	8.6	12.8	54.2	67.0	15.3	60.2	75.5	88.7	64.7	757
Scheduled tribe	5.4	5.1	10.5	13.6	49.0	62.6	18.9	54.1	73.0	85.7	51.4	1,117
Other backward class	3.8	6.4	10.2	14.5	53.0	67.5	18.3	59.4	77.7	86.9	56.0	642
Other	4.2	8.5	12.7	12.8	49.1	61.8	17.0	57.5	74.5	83.0	58.4	1,124
Total	4.1	6.6	10.7	13.3	50.8	64.1	17.5	57.3	74.8	85.7	57.2	3,645

Note: Total includes women who don't know their caste/tribe, who are not shown separately. Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

¹ Total demand is the sum of unmet need and met need

² Percentage of demand satisfied is met need divided by total demand

³ Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

Table 30 Unmet need for family planning by district

Percentage of currently married women age 15-49 with unmet need for family planning by district, Tripura, 2015-16, and total for NFHS-3

District	Total unmet need	Unmet need for spacing	Unmet need for limiting	Number of women
Dhalai	7.0	3.0	4.0	337
North Tripura	8.6	3.4	5.2	620
South Tripura	9.7	4.2	5.5	850
West Tripura	12.5	4.5	8.0	1,837
Tripura	10.7	4.1	6.6	3,645
NFHS-3 (2005-06)	12.4	3.7	8.7	1,338

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting

Table 31 Pregnancy outcome

Percent distribution of last pregnancies among women age 15-49 during the five years preceding the survey by pregnancy outcome, according to background characteristics, Tripura, 2015-16

Background characteristic	Pregnancy outcome				Total	Number of pregnancies
	Live birth	Abortion	Miscarriage	Stillbirth

Note: Total includes births to women who don't know their caste/tribe and births delivered in an "other" places, who are not shown separately.

na = Not applicable

¹ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.

² Based on the last live birth in the five years preceding the survey

³ Postnatal checks are checks on the woman's health within 42 days of the birth

⁴ Includes nongovernmental organizations or trust hospitals/clinics

() Based on 25-49 unweighted cases

Table 46 Delivery and postnatal care by district

Percentage of live births in the five years preceding the survey delivered in a health facility, percentage delivered with assistance from health personnel and percentage delivered by caesarean section, and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check within two days of birth for their most recent birth, by district, Tripura, 2015-16

District	Percentage of births delivered in a public health facility	Percentage of births delivered in a private health facility	Percentage of births delivered in a health facility	Percentage of deliveries assisted by health personnel ¹	Percentage of births delivered by caesarean section	Number of births	Percentage of women with a postnatal check within two days of birth ²	Number of women
----------	--	---	--	--	---	---------------------	---	--------------------

Dhalai	72.0	4.2	76.2	77.3	8.3	131	62.9	113
North Tripura	50.9	14.0	64.8	65.7	10.5	312	51.0	249

¹ Includes newborns who received a health check after the first week

² Includes nongovernmental organizations or trust hospitals/clinics

() Based on 25-49 unweighted cases

Table 50 Trends in maternal care indicators

Maternal care indicators for births during the three years preceding the survey by residence, NFHS-4 and NFHS-3, Tripura

Indicator	NFHS-4 (2015-16)	NFHS-3 (2005-06)
-----------	---------------------	---------------------

URBAN		
Percentage who received antenatal care ¹	94.6	85.5
Percentage who had at least four antenatal care visits ¹	77.0	65.2
Percentage who received antenatal care within the first trimester of pregnancy ¹	77.9	49.3
Percentage who received full antenatal care ^{1,2}	9.4	21.7
Percentage of births delivered in a health facility ³	93.7	75.7
Percentage of deliveries assisted by health personnel ^{3,4}	93.7	79.7
RURAL		
Percentage who received antenatal care ¹	89.3	77.7
Percentage who had at least four antenatal care visits ¹	61.1	46.6
Percentage who received antenatal care within the first trimester of pregnancy ¹	63.3	43.5
Percentage who received full antenatal care ^{1,2}	6.4	5.7
Percentage of births delivered in a health facility ³	76.2	44.7
Percentage of deliveries assisted by health personnel ^{3,4}	77.3	45.3
TOTAL		
Percentage who received antenatal care ¹	90.6	78.8
Percentage who had at least four antenatal care visits ¹	65.0	49.2
Percentage who received antenatal care within the first trimester of pregnancy ¹	66.9	44.3
Percentage who received full antenatal care ^{1,2}	7.2	7.9
Percentage of births delivered in a health facility ³	80.3	48.8
Percentage of deliveries assisted by health personnel ^{3,4}	81.2	49.9

¹ Based on the last birth to women in the three years preceding the survey

² Full antenatal care includes having received at least four antenatal care visits, having received at least one tetanus toxoid (TT) injection, and having taken iron and folic acid (IFA) tablets or syrup for 100 or more days

³ Based on all births in the three years preceding the survey

⁴ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

Table 51 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present for at least one antenatal check-up, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Tripura, 2015-16

Antenatal and delivery care information	Urban	Rural	Total
Percentage of men for whom the youngest child's mother received antenatal care	(100.0)	78.9	84.7
Percentage of men who were present at any antenatal check-up	(70.5)	56.6	60.4
Percentage who were told by a health provider or worker about the following signs of pregnancy complications:			
Vaginal bleeding	(55.3)	46.0	48.5
Convulsions	(60.0)	48.1	51.4
Prolonged labour	(62.0)	52.6	55.2
Severe abdominal pain	(64.1)	52.6	55.8
High blood pressure	(60.0)	44.1	48.5
Percentage ever told what to do if the mother had any pregnancy complications	(66.6)	66.1	66.2
Percentage whose youngest child age 0-35 months was delivered in a health facility	(95.2)	78.7	83.2
Percentage to whom a health provider or worker spoke about the following aspects of maternal care:			
The importance of delivering in a health facility	(77.1)	76.6	76.8
The importance of proper nutrition for the mother during pregnancy	(76.1)	67.7	70.0
Family planning or delaying his next child	(64.1)	60.1	61.2
Number of men with a youngest child age 0-35 months	47	126	173
Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of:			
Cord care	*	(30.7)	(28.4)
Breastfeeding the baby immediately after delivery	*	(44.9)	(41.4)
Keeping the baby warm immediately after birth	*	(40.8)	(37.6)
Number of men whose youngest child age 0-35 months was not delivered in a health facility	2	27	29
() Based on 25-49 unweighted cases			
* Percentage not shown; based on fewer than 25 unweighted cases			

Table 52 Vaccinations by background characteristics

Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report) and percentage with a vaccination card seen by the interviewer, by background characteristics, Tripura, 2015-16, and total for NFHS-3

Other	6.2	370	(50.5)	(48.1)	(15.1)	(51.9)	(4.4)	(51.9)	(15.0)	(7.5)	(15.2)	(0.0)	(23.4)	(17.2)	23
Total	4.9	1,252	65.7	46.3	17.7	48.5	6.9	48.5	23.2	10.0	19.0	0.0	18.7	17.9	61

Note: ORT includes a solution prepared from an oral rehydration salt (ORS) packet and/or gruel and/or increased fluids. Total includes children whose caste/tribe is not known, who are not shown separately.

¹ Excludes pharmacy, shop, and traditional healer

² Includes antimotility drugs, other drugs, and unknown drugs

() Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 56 Feeding practices during diarrhoea

Percent distribution of children under age five who had diarrhoea in the two weeks preceding the survey by amount of liquids and food given compared with normal practice, according to sex, Tripura, 2015-16

Background characteristic	Amount of liquids given							Amount of food given							Percent- age given increased fluids and continued feeding ¹	Percent- age given ORT and continued feeding ¹	Number of children with diarrhoea	
	More	Same as usual	Somewhat less	Much less	None	Don't know	Total	More	Same as usual	Somewhat less	Much less	None	Never gave food	Don't know				Total
Sex																		
Male	(5.9)	(32.5)	(16.5)	(45.2)	(0.0)	(0.0)	(100.0)	(0.0)	(19.9)	(34.9)	(45.2)	(0.0)	(0.0)	(0.0)	(100.0)	(5.9)	(44.6)	35
Female	(8.4)	(31.2)	(18.9)	(36.1)	(5.3)	(0.0)	(100.0)	(0.0)	(20.9)	(32.7)	(37.8)	(0.0)	(8.6)	(0.0)	(100.0)	(8.4)	(29.8)	26
Total	6.9	32.0	17.5	41.3	2.2		100.0	0.0	20.3	34.0	42.1	0.0	3.6		100.0	6.9	38.4	61

Note: It is recommended that children should be given more liquids to drink during diarrhoea and food should not be reduced.

ORT = Oral rehydration therapy, which includes a solution prepared from an oral rehydration salt (ORS) packet and/or gruel and/or increased fluids

¹ Continued feeding includes children who were given more, same as usual, or somewhat less food during the diarrhoea episode

() Based on 25-49 unweighted cases

Table 57 Knowledge of ORS packets

Percentage of all women and percentage of women who had a live birth in the five years preceding the survey who know about ORS packets for treatment of diarrhoea, by background characteristics, Tripura, 2015-16

Background characteristic	All women		Women who gave birth in the past five years	
	Percentage who know about ORS packets	Number of women	Percentage who know about ORS packets	Number of women

Note: Total includes children whose caste/tribe is not known, who are not shown separately.

ICDS = Integrated Child Development Services

¹ Supplementary food includes both food cooked and served at the AWC on a daily basis and food given in the form of take home rations

² Services are usually provided to breastfeeding mothers during the first six months of breastfeeding

Table 60 Nutritional status of children

Percentage of children under age five years classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, by background characteristics, Tripura, 2015-16, and total for NFHS-3

Background characteristic	Height-for-age ¹			Weight-for-height				Weight-for-age				Number of children

Living with both parents	7.9	23.9	-1.0	6.0	16.7	3.0	-0.8	5.0	23.8	1.1	-1.2	1,045
Living with one or neither parent	9.5	28.5	-1.0	9.5	17.8	2.9	-0.9	8.4	27.3	1.1	-1.2	107
Total	8.1	24.3	-1.0	6.3	16.8	3.0	-0.8	5.3	24.1	1.1	-1.2	1,152
NFHS-3 (2005-06)	14.7	35.7	-1.5	8.6	24.6	2.2	-1.2	15.7	39.6	0.1	-1.7	564

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards adopted in 2006. The indices in this table are NOT comparable to those based on the previously used 1977 NCHS/CDC/WHO Reference. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Total includes children whose birth order is "6+", children whose birth size is very small, and children whose mother's nutritional status is missing, who are not shown separately.

¹ Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm; standing height is measured for all other children

² Includes children who are below -3 standard deviations (SD) from the WHO Growth Standards population median

³ Excludes children whose mothers were not interviewed

⁴ First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval

⁵ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

⁶ Includes children whose mothers are deceased

⁷ Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status in terms of BMI (Body Mass Index) is presented in Table 70.

Table 61 Initial breastfeeding

Among last-born children who were born in the two years preceding the survey, the percentage who were ever breastfed, and the percentage who started breastfeeding within one hour and one day of birth, and among last-born children born in the two years preceding the survey who were ever breastfed, the percentage who received a prelacteal feed, by background characteristics, Tripura, 2015-16

Background characteristic	Among last-born children born in the past two years:				Among last-born children born in the past two years who were ever breastfed:	
	Percentage ever breastfed	Percentage who started breastfeeding within one hour of birth ¹	Percentage who started breastfeeding within one day of birth ²	Number of last-born children	Percentage who received a prelacteal feed ³	Number of last-born ever breastfed children

Total	98.1	46.2	90.2	486	2.9	476

Note: Table is based on last-born children born in the past two years whether the children are living or dead at the time of interview. Total includes Christian children, children whose birth was assisted by other/no one, and children who were delivered in an "other" place of delivery, who are not shown separately.

TBA = Traditional birth attendant

¹ Includes children who started breastfeeding immediately after birth

² Includes children who started breastfeeding within one hour of birth

³ Children given something other than breast milk during the first three days of life

⁴ Not a Hindu, Muslim, or Christian

⁵ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel

() Based on 25-49 unweighted cases

Table 62 Breastfeeding status by age

Percent distribution of youngest children under two years living with the mother by breastfeeding status, percentage currently breastfeeding, and percentage of all children under two years using a bottle with a nipple, according to age in months, Tripura, 2015-16

Age in months	Breastfeeding and consuming:							Percentage currently breastfeeding	Number of youngest children under two years living with the mother	Percentage using a bottle with a nipple	Number of all children under two years
	Not breastfeeding	Exclusively breastfed	Plain water only	Non-milk liquids/juice	Other milk	Complementary foods	Total				
2-3	0.0	72.1	6.2	0.0	11.6	10.0	100.0	100.0	45	8.6	45
4-5	0.0	68.7	7.3	0.0	16.0	8.0	100.0	100.0	54	24.0	54
6-8	2.3	52.6	6.3	1.6	23.6	13.6	100.0	97.7	61	25.9	61
9-11	1.6	24.7	5.9	2.4	12.1	53.4	100.0	98.4	51	21.8	51
12-17	3.4	23.0	3.2	0.0	4.8	65.6	100.0	96.6	109	25.2	109
18-23	6.2	20.6	0.0	1.1	7.4	64.9	100.0	93.8	134	21.5	136
<4	0.0	72.4	6.9	0.0	10.1	10.6	100.0	100.0	65	8.9	66
<6	0.0	70.7	7.1	0.0	12.8	9.4	100.0	100.0	119	15.7	121
6-9	2.1	48.9	6.1	1.4	23.0	18.5	100.0	97.9	69	28.0	69
12-15	4.3	21.4	3.0	0.0	5.6	65.7	100.0	95.7	87	27.9	87
12-23	4.9	21.6	1.4	0.6	6.2	65.2	100.0	95.1	243	23.2	245
20-23	8.4	15.3	0.0	1.8	6.8	67.7	100.0	91.6	80	22.9	82

Note: Breastfeeding status refers to a "24-hour" period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus children who receive breast milk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well. Children age <4 and age <6 include children whose age is less than 2 months, who are not shown separately.

Table 63 Median duration of breastfeeding and infant and young child feeding (IYCF) practices

Median duration (months) of breastfeeding among last-born children born in the last three years and percentage of youngest children age 6-23 months living with the mother who were fed with appropriate feeding practices based on the number of food groups and times they were fed during the day or night preceding the survey, by breastfeeding status and background characteristics, Tripura, 2015-16

Background characteristic	Median duration (months) of breastfeeding among last-born children born in the last three years ¹				Among breastfed children 6-23 months, percentage fed:				Among all children 6-23 months, percentage fed:				
	Any breast-feeding	Exclusive breast-feeding	Predom- inant breast-feeding ²	Number of children	4+ food groups ³	Minimum meal frequency ⁴	Both 4+ food groups and minimum meal frequency	Number of children	Breastmilk, milk, or milk products ⁵	4+ food groups ³	Minimum meal frequency ⁶	With 3 IYCF practices ⁷	Number of children

Total	≥36.0	7.0	7.9	728	15.1	21.4	5.3	341	97.9	16.1	22.4	5.9	356

Note: Total includes children who belonging to “other” religions, who are not shown separately.

a = Omitted because the smoothed percentage is below 50% in the first age cell (<2 months) and therefore the median cannot be calculated

na = Not applicable

¹ Median durations are based on the distributions at the time of the survey of the proportion of births by months since birth. Includes children living and deceased at the time of the survey. It is assumed that children not currently living with the mother are not currently breastfeeding.

² Either exclusively breastfed or received breast milk and plain water and/or non-milk liquids only

³ Food groups are: a. infant formula, milk other than breast milk, cheese or yogurt or other milk products; b. foods made from grains or roots, including porridge or gruel, fortified baby food; c. vitamin A-rich fruits and vegetables; d. other fruits and vegetables; e. eggs; f. meat, poultry, fish, shellfish, or organ meats; g. beans, peas, lentils, or nuts; h. foods made with oil, fat, *ghee*, or butter

⁴ Receiving solid or semi-solid food at least twice a day for breastfed infants 6-8 months and at least three times a day for breastfed children 9-23 months

⁵ Breastfeeding, or not breastfeeding and receiving two or more feedings of commercial infant formula, fresh, tinned, and powdered animal milk, and yogurt

⁶ Children are fed the minimum recommended number of times per day according to their age and breastfeeding status as described in footnote 4 for breastfed children. Non-breastfed children age 6-23 months are considered to be fed with a minimum standard of three Infant and Young Child Feeding Practices if they receive other milk or milk products at least twice a day, receive the minimum meal frequency, and receive solid or semi-solid foods from at least four food groups not including the milk or milk products food group.

⁷ Non-breastfed children age 6-23 months are considered to be fed with a minimum standard of three Infant and Young Child Feeding Practices if they receive other milk or milk products at least twice a day, receive the minimum meal frequency, and receive solid or semi-solid foods from at least four food groups not including the milk or milk products food group

() Based on 25-49 unweighted cases

*Based on fewer than 25 unweighted cases

Table 64 Child feeding practices and nutritional status of children by district

Among last-born children in the past 2 years, percentage breastfed within one hour of birth, percentage of youngest children under age 6 months living with the mother who are exclusively breastfed, and percentage of children under age five years classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, by district, Tripura, 2015-16

District	Among last-born children in the past 2 years	Number of children	Percentage of children under age 6 months exclusively breastfed ¹	Number of children	Height-for-age ²	Weight-for-height	Weight-for-age	Number of children
	Percentage breastfed within one hour of birth				Percentage below -2 SD ³	Percentage below -2 SD ³	Percentage below -2 SD ³	
Dhalai	53.4	46	(71.0)	15	32.5	23.3	27.2	124
North Tripura	55.5	115	(66.3)	25	29.0	14.8	30.7	281
South Tripura	47.9	91	*	27	25.0	21.5	25.8	232
West Tripura	39.5	234	(72.3)	51	19.5	14.2	19.0	515
Tripura	46.2	486	70.7	119	24.3	16.8	24.1	1,152

¹ Based on the youngest child living with the mother

² Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm; standing height is measured for all other children

³ Based on the WHO Growth Standards population median

() Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 65 Prevalence of anaemia in children

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Tripura, 2015-16 and total for NFHS-3

Background characteristic	Anaemia status by haemoglobin level			Any anaemia (<11.0 g/dl)	Number of children
	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0g/dl)		
Age in months

Table 65 Prevalence of anaemia in children – Continued

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Tripura, 2015-16 and total for

Background characteristic	Anaemia status by haemoglobin level			Any anaemia (<11.0 g/dl)	Number of children
	Mild (10.0 - 10.9 g/dl)	Moderate (7.0 - 9.9 g/dl)	Severe (<7.0 g/dl)		
Child's living arrangements					
Living with both parents	30.7	17.9	0.2	48.8	939
Living with one or neither parent	28.4	14.7	0.0	43.1	89
Mother's anaemia status⁴					
Not anaemic	27.4	10.7	0.5	38.6	456
Mildly anaemic	33.3	21.5	0.0	54.8	427
Moderately/severely anaemic	32.1	27.7	0.0	59.8	124
Total	30.5	17.6	0.2	48.3	1,029
NFHS-3 (2005-06)	27.5	34.6	0.7	62.9	535

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes children whose birth order is 6+ and children whose caste/tribe is not known, who are not shown separately.

¹ Excludes children whose mothers were not interviewed

² For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Includes children whose mothers are deceased

⁴ Mildly anaemic is classified as 10.0 - 11.9 g/dl for non-pregnant women and 10.0 - 10.9 g/dl for pregnant women. Moderately/severely anaemic is <10.0 g/dl. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known.

Table 66 Micronutrient intake among children

Percentage of youngest children age 9-23 months living with the mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children age 9-59 months who were given vitamin A supplements in the six months preceding the survey and percentage of children age 6-59 months who were given iron supplements in the past seven days, who were given deworming medication in the six months preceding the survey, and who live in households using iodized salt, by background characteristics, Tripura, 2015-16, and total for NFHS-3

Background characteristic	Youngest children age 9-23 months living with their mother			Children age 9-59 months		Children age 6-59 months			Children age 6-59 months in households with salt tested	
	Percentage who consumed foods rich in vitamin A in past 24 hours ¹	Percentage who consumed foods rich in iron in past 24 hours ²	Number of children	Percentage given vitamin A supplements in past 6 months	Number of children	Percentage given iron supplements in past 7 days	Percentage given deworming medication in past 6 months ³	Number of children	Percentage living in households using iodized salt ⁴	Number of children

Age 15-49										

Note: Table is based on women and men who stayed in the household the night before the interview. Prevalence is adjusted for altitude and for smoking status, if known, using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Totals include women and men who don't know their caste/tribe, who are not shown separately. Haemoglobin in g/dl = grams per decilitre.

na = Not applicable

¹ For pregnant women the value is 10.0-10.9 g/dl

² For pregnant women the value is <11.0 g/dl

() Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 72 Nutritional status and anaemia among children and women by district

Percentage of children age 6-59 months classified as having anaemia and percentage of women age 15-49 with anaemia and specific body mass index (BMI) levels by district, Tripura, 2015-16

District	Percentage of children having any anaemia (<11.0 g/dl)	Number of children	Percentage of women having any anaemia (<12.0 g/dl) ¹	Number of women	Women with BMI <18.5 (total thin)	Women with BMI ≥25.0 (overweight or obese)	Number of women ²
Dhalai	50.4	112	56.4	433	15.6	13.5	416
North Tripura	37.3	243	52.8	822	28.7	13.7	798
South Tripura	51.8	220	54.3	1,080	19.4	13.6	1,050
West Tripura	52.0	454	54.8	2,298	15.9	18.4	2,272
Tripura	48.3	1,029	54.5	4,634	18.9	16.0	4,537

Note: Table is based on children/women who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). The Body Mass Index (BMI) is expressed as the ratio of weight in kilograms to the square of height in meters (kg/m²).

¹ For pregnant women, the value is <11.0 g/dl

² Excludes pregnant women and women with a birth in the preceding 2 months

Table 73 Knowledge and prevention of HIV/AIDS

Percentage of women and men age 15-49 who have heard of HIV or AIDS and who, in response to prompted questions, say that people can reduce the risk of getting HIV/AIDS by using a condom every time they have sexual intercourse, who know that the risk of HIV/AIDS can be reduced by limiting sex to one uninfected partner, who have a comprehensive knowledge about HIV/AIDS, and who know that HIV/AIDS can be transmitted from a mother to a baby, by background characteristics, Tripura, 2015-16

Background characteristic	Percentage who have heard of HIV or AIDS		Percentage who know that people can reduce their chances of getting HIV/AIDS by using a condom every time they have sex		Percentage who know that the risk of HIV/AIDS can be reduced by limiting sex to one uninfected partner ¹		Percentage who have a comprehensive knowledge about HIV/AIDS ²		Percentage who know that HIV/AIDS can be transmitted from a mother to her baby		Number

SBP=Systolic blood pressure; DBP=Diastolic blood pressure

¹ A woman is classified as having hypertension if she has SBP levels ≥140 mmHg or DBP ≥90 mmHg at the time of the survey, or she is currently taking antihypertension medication to control blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

Table 83.2 Blood pressure status: Men

Among men age 15-49, prevalence of hypertension, percent distribution of blood pressure values, and percentage having normal blood pressure and taking medication to lower blood pressure, by background characteristics, Tripura, 2015-16

Background characteristic	Prevalence of hypertension ¹	Normal	Pre-hypertensive	Hypertensive			Total	Percentage with normal blood pressure and taking medicine to lower blood pressure	Number of men
		SBP <120 mmHg and DBP <80 mmHg	SBP 120-139 mmHg or DBP 80-89 mmHg	Stage 1: SBP 140-159 mmHg or DBP 90-99 mmHg	Stage 2: SBP 160-179 mmHg or DBP 100-109 mmHg	Stage 3: SBP ≥180 mmHg or DBP >110 mmHg

Total	39.5	29.2	30.5	81.4	73.5	942	819

Note: Total includes women and men who have more than 5 living children, who are not shown separately.

¹ Specified reasons are: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws.

² Specified reasons are: knows husband has a sexually transmitted disease, knows husband has sex with other women, and is tired or not in the mood.

³ Specified behaviours are: gets angry and reprimands her, refuses to give her financial support, uses force to have sex, and has sex with another woman.

⁴ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

() Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 95 Experience of physical and sexual violence

Percentage of women age 15-49 who have ever experienced physical or sexual violence; among those who have experienced physical violence, the person committing the violence; and among those who have experienced sexual violence, the person committing the violence the first time, by marital status, Tripura, 2015-16

Type of violence/perpetrator	Ever-married	Never married	Total
Type of violence experienced			
Physical violence only	20.8	11.1	18.9
Sexual violence only	1.2	0.0	1.0
Physical and sexual violence	8.8	0.0	7.1
Physical or sexual violence	30.8	11.1	27.0
Number of women	576	138	714
Person committing physical violence¹			
Current husband	88.8	*	81.4
Former husband	0.4	*	0.4
Father/step-father	10.0	*	12.2
Mother/step-mother	19.3	*	22.6
Sister/brother	1.3	*	3.0
Other relative	0.6	*	0.6
Mother in-law	1.1	*	1.0
Father in-law	0.6	*	0.6
Other in-law	0.6	*	0.6
Teacher	0.7	*	2.1
Other	0.4	*	1.4
Number who experienced physical violence since age 15	170	15	186
Person committing sexual violence the first time			
Current husband	96.3	nc	96.3
Other relative	3.7	nc	3.7
Number who experienced sexual violence	58	0	58

Note: All women were asked about their experience of physical violence since age 15. Ever-married women were also asked about their experience of spousal physical violence at any age.

¹ Women can report more than one person who committed the violence

* Percentage not shown; based on fewer than 25 unweighted cases

Table 96 Experience of violence during pregnancy

Among women age 15-49 who have ever been pregnant, percentage who have ever experienced physical violence during pregnancy, by background characteristics, Tripura, 2015-16

Background characteristic	Percentage who experienced violence during pregnancy	Number of women who have ever been pregnant
Age		
15-19	(3.4)	27

Note: Total includes women who have no living children, women with 5+ living children, and Christian women, who are not shown separately.

¹ Not a Hindu, Muslim, or Christian

() Based on 25-49 unweighted cases

Table 97 Forms of spousal violence

Percentage of ever-married women age 15-49 who have experienced various forms of violence committed by their husband ever and in the 12 months preceding the survey, Tripura, 2015-16

Type of violence	Ever ¹	In the past 12 months		
		Often	Sometimes	Often or sometimes
Physical violence				
Any form of physical violence	26.3	2.6	17.5	20.1
Pushed her, shook her, or threw something at her	10.7	1.0	6.6	7.7
Twisted her arm or pulled her hair	8.4	1.3	3.6	4.9
Slapped her	23.6	2.1	14.6	16.7
Punched her with his fist or with something that could hurt her	6.0	1.2	3.1	4.3
Kicked her, dragged her, or beat her up	8.2	0.5	5.7	6.2
Tried to choke her or burn her on purpose	1.0	0.2	0.5	0.8
Threatened her or attacked her with a knife, gun, or any other weapon	0.4	0.3	0.0	0.3
Sexual violence				
Any form of sexual violence	9.7	2.3	6.3	8.6
Physically forced her to have sexual intercourse with him even when she did not want to	9.0	2.3	5.6	7.9
Physically forced her to perform any sexual acts she did not want to	2.1	0.8	0.8	1.6
Forced her with threats or in any other way to perform sexual acts she did not want to	5.0	0.7	3.6	4.3
Emotional violence				
Any form of emotional violence	14.1	1.4	10.2	11.6
Said or did something to humiliate her in front of others	10.0	0.7	6.5	7.2
Threatened to hurt or harm her or someone close to her	2.7	0.9	1.4	2.3
Insulted her or made her feel bad about herself	10.3	1.1	7.6	8.7
Any form of physical and/or sexual violence	27.9	3.7	18.6	22.3
Any form of physical and sexual violence	8.1	1.2	5.3	6.4
Any form of physical and/or sexual and/or emotional violence	29.9	4.2	20.1	24.3
Any form of physical and sexual and emotional violence	5.3	0.4	4.0	4.4
Any violence by women against their husband ²	1.9	0.4	1.4	1.8
Number of ever-married women	576	576	576	576

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Includes in the past 12 months

² Any violence by women against their husband when he was not already beating or physically hurting her

Table 98 Spousal violence by background characteristics

Percentage of ever-married women age 15-49 who have ever experienced emotional, physical, or sexual violence committed by their husband, according to background characteristics, Tripura, 2015-16

Table 99 Spousal violence by husband's characteristics and empowerment indicators – *Continued*

Percentage of ever-married women age 15-49 who have ever suffered emotional, physical, or sexual violence committed by their husband, according to his characteristics, marital characteristics, and selected empowerment indicators, Tripura, 2015-16

Background characteristic	Emotional violence	Physical violence	Sexual violence	Physical or sexual violence	Emotional, physical, or sexual violence	Number of women
Number of reasons given for refusing to have sexual intercourse with husband⁵						
0	12.2	19.4	8.1	20.4	22.5	317
1-2	21.4	41.3	8.3	41.7	44.9	84
3	14.1	31.4	13.2	34.8	36.1	174
Afraid of husband						
Most of the time	(56.1)	(68.7)	(43.4)	(71.7)	(76.5)	40
Sometimes	12.0	24.4	7.9	26.1	28.0	466
Never	4.3	14.2	2.0	14.7	15.8	70
Total	14.1	26.3	9.7	27.9	29.9	576

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women whose husband drinks alcohol but never gets drunk, women who are older than their husband or the same age, women whose husband displayed 5-6 marital control behaviours, and women who agree with 7 reasons for which wife-beating is justified, who are not shown separately

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

³ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives.

⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

() Based on 25-49 unweighted cases

Table 100 Injuries to women due to spousal violence

Percentage of ever-married women age 15-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Tripura, 2015-16

Type of spousal violence experienced	Percentage of women who have had:					Number of ever-married women
	Cuts, bruises, or aches	Severe burns	Eye injuries, sprains, dislocations, or minor burns	Deep wounds, broken bones, broken teeth, or any other serious injury	Any of these injuries	
Experienced physical violence¹						
Ever ²	28.1	4.4	30.9	16.1	46.4	151
In the past 12 months	30.7	5.3	35.4	14.7	53.2	116
Experienced sexual violence						
Ever ²	65.8	7.6	47.1	46.8	73.6	56
In the past 12 months	61.6	7.2	44.3	40.4	70.4	50
Experienced physical or sexual violence						
Ever ²	30.1	4.9	30.2	18.4	47.4	160
In the past 12 months	32.7	5.7	33.7	17.8	53.1	128
Experienced physical and sexual violence						
Ever ²	(66.2)	(6.6)	(53.0)	(44.9)	(75.5)	46
In the past 12 months	(65.0)	(6.5)	(53.2)	(38.3)	(76.7)	37

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Excludes women who reported violence only in response to a direct question on violence during pregnancy

² Includes violence in the past 12 months

() Based on 25-49 unweighted cases

Table 101 Help seeking

Percentage of women age 15-49 who have ever experienced physical or sexual violence by whether they have ever sought help,

according to the type of violence experienced and marital status, Tripura, 2015-16

Source	Type of violence experienced			Marital status		Total
	Physical only	Sexual only	Both physical and sexual	Ever-married	Never married	
Help seeking						
Never sought help and never told anyone	85.4	*	77.1	84.0	*	83.7
Never sought help but told someone	6.7	*	5.2	5.5	*	6.0
Sought help	7.9	*	17.8	10.6	*	10.2
Number of women who experienced violence	135	7	51	177	15	193

¹ Women can report more than one source from which they sought help.
* Percentage not shown; based on fewer than 25 unweighted cases

Table A.1 List of variables for sampling errors, Tripura, 2015-16

Variable	Estimate	Base population
HOUSEHOLDS		
Using an improved source of drinking water	Proportion	Households
Using an improved sanitation facility	Proportion	Households
Using iodized salt	Proportion	Households
Sex ratio (females per 1,000 males)	Ratio	De facto household population, all ages

WOMEN		
No schooling (Females age 6 years and above)	Proportion	<i>De facto</i> household population of females age 6 and above
Urban residence	Proportion	Women age 15-49
No schooling (Women age 15-49)	Proportion	Women age 15-49
Completed 10 or more years of schooling	Proportion	Women age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Women age 15-49
Currently married	Proportion	Women age 15-49
Married before age 18	Proportion	Women age 20-49
Currently using any contraceptive method	Proportion	Currently married women age 15-49
Currently using a modern contraceptive method	Proportion	Currently married women age 15-49
Currently using a traditional contraceptive method	Proportion	Currently married women age 15-49
Currently using pill	Proportion	Currently married women age 15-49
Currently using IUD/PPIUD	Proportion	Currently married women age 15-49
Currently using condom/ <i>Nirodh</i>	Proportion	Currently married women age 15-49
Currently using female sterilization	Proportion	Currently married women age 15-49
Using public health sector source of contraception	Proportion	Women age 15-49 currently using modern methods of contraception
Unmet need for family planning	Proportion	Currently married women age 15-49
Want no more children	Proportion	Currently married women age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married women age 15-49
Mother received four or more antenatal care (ANC) visits	Proportion	Women with at least one birth in last five years (last birth)
Took iron and folic acid (IFA) for 100 days or more	Proportion	Women with at least one birth in last five years (last birth)
Birth registration	Proportion	<i>De jure</i> children under age 5 years
Births delivered by a health personnel	Proportion	Births in last 5 years
Institutional delivery	Proportion	Births in last 5 years
Postnatal check for mother within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Postnatal check for newborn within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Exclusive breastfeeding	Proportion	Children under age 6 months
Children with diarrhoea	Proportion	Children under age 5 years
Treated with oral rehydration salt (ORS) packets	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Children with diarrhoea taken to a health provider	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Child received BCG vaccination	Proportion	Children age 12-23 months
Child received DPT vaccination (3 doses)	Proportion	Children age 12-23 months
Child received polio vaccination (3 doses)	Proportion	Children age 12-23 months
Child received measles vaccination	Proportion	Children age 12-23 months
Child received hepatitis B vaccination (3 doses)	Proportion	Children age 12-23 months
Child with all basic vaccinations	Proportion	Children age 12-23 months
Children given vitamin A supplement in last 6 months	Proportion	Children age 9-59 months
Height-for-age, stunting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-height, wasting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-age, underweight (below -2SD)	Proportion	Children under age 5 years who were measured
Children with any anaemia	Proportion	Children age 6-59 months with an anaemia test
Women with any anaemia	Proportion	Women age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Women age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Women age 15-49 who were measured
Have heard of HIV/AIDS	Proportion	Women age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Women age 15-49
Ever experienced physical or sexual violence	Proportion	Women age 15-49
Total fertility rate (last 3 years)	Rate	Women
Neonatal mortality	Rate	Births in last 5 years
Postneonatal mortality	Rate	Births in last 5 years
Infant mortality	Rate	Births in last 5 years
Child mortality	Rate	Births in last 5 years
Under-five mortality	Rate	Births in last 5 years
MEN		
No schooling (Males age 6 years and above)	Proportion	<i>De facto</i> household population of males age 6 and above
Urban residence	Proportion	Men age 15-49
No schooling (Men age 15-49)	Proportion	Men age 15-49
Completed 10 or more years of schooling	Proportion	Men age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Men age 15-49
Currently married	Proportion	Men age 15-49
Married before age 21	Proportion	Men age 25-49
Want no more children	Proportion	Currently married men age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married men age 15-49
Men with any anaemia	Proportion	Men age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Men age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Men age 15-49 who were measured
Have heard of HIV/AIDS	Proportion	Men age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Men age 15-49

Table A.2 Sampling errors: Total sample, Tripura, 2015-16

Variable	Value (R)	Standard error (SE)	Number of cases		Design effect (DEFT)	Relative standard error (SE/R)	Confidence limits	
			Unweighted (N)	Weighted (WN)			R-2SE	R+2SE
HOUSEHOLDS
